MINI PROJECT**

XENOS

Course Code: CS2102-1

Course Name : Database Management System

Semester: IV SEM

Section: C

Submitted To:

**Dr. Pradeep Kanchan
Assistant Professor Gd-III
Department of CSE, NMAMIT**

Submitted By:

NAME: Shaldon Barnes

USN:NNM23CS172

NAME: Sharanya Aithal K.S.

USN:NNM23CS177

Date of submission: 23/04/2025

Signature of Course Instructor

ACKNOWLEDGEMENT

First and foremost, I thank my parents for what I am and where I am today, without whose hard work and sacrifice I would not be here today.

I would like to sincerely express my gratitude to all those who provided me suggestions, coordination, encouragement and support for the substantial outcome of our project.

My heartfelt thanks to our sir **Dr. Pradeep Kanchan** , Assistant professor GD-III, department of CSE for all the support and guidance.

I would like to thank my team mate **Sharanya Aithal** who have constantly supported me throughout this project. I would like to thank all my friends and professors who have helped us during the project.

I sincerely acknowledge the internet and various sources for providing valuable information that helped me in this project.

Shaldon Barnes
NNM23CS172

ABSTRACT

“XENOS” is a comprehensive airport operation management system designed as a database-driven application to efficiently streamline and manage core airport activities. It handles critical aspects such as flight schedules, passenger information, and reporting functionalities tailored for airport staff, employees, and crew members. By automating essential airport processes, XENOS enhances operational efficiency, ensures data accuracy, and strengthens overall security across the airport ecosystem.

INTRODUCTION

Airports are complex environments that require efficient management systems to handle a wide range of operations , from flight scheduling to passenger handling and employee coordination. Traditional methods often involve manual processes that are time-consuming and error-prone.

XENOS is a database-driven Airport Operation Management System developed to streamline and automate essential airport activities. The system is designed to manage flight schedules, passenger details, employee data, and reporting functionalities. All in one unified platform. It ensures that airport staff, employees, and crew members can efficiently access, update, and manage the information relevant to their roles.

By integrating automation into key airport processes, XENOS improves operational efficiency, enhances accuracy, and ensures higher security standards. With a user-friendly interface and real-time data access, the system reduces manual workload and enables better coordination across various departments within the airport.

PROBLEM STATEMENT

Airports handle a vast amount of data and operations on a daily basis, including flight management, passenger processing, and staff coordination. Many existing systems used for airport operations are either fragmented, partially manual, or outdated, leading to inefficiencies, data inconsistencies, delays, and potential security risks.

The lack of a centralized, automated, and user-friendly system results in increased workload for airport staff, slower decision-making, and difficulty in accessing real-time information. This can directly impact airport performance, passenger satisfaction, and overall operational safety.

There is a clear need for a comprehensive airport operation management system that can centralize data, automate workflows, improve communication, and ensure the secure handling of sensitive information.

XENOS is proposed to solve these challenges by providing a database-driven platform that efficiently manages flight schedules, passenger details, staff operations, and reporting functionalities all in one place.

OBJECTIVES

The general objective of this project is to develop a reliable, centralized, and user-friendly Airport Operation Management System that automates and streamlines essential airport processes, enhancing efficiency, accuracy, and coordination among airport staff, employees, and crew members.

Specific objectives are:

1. 24×7 access to flight schedules, passenger data, and staff details
2. Organize flight and crew schedules more effectively
3. Reduce manual work for staff by automating data entry and reporting
4. Allow employees and crew to view their schedules and assignments anytime
5. Access the system through desktops, laptops, tablets, and mobile phones
6. Improve communication between departments through centralized data access
7. Minimize errors in data handling and improve operational accuracy
8. Manage multiple terminals, airlines, and departments within a single platform
9. Enhance security with role-based access control and secure login
10. Improve staff productivity by reducing paperwork and redundant tasks

HARDWARE/SOFTWARE REQUIREMENT

Hardware:

- 1.6GHz or faster processor
- At least 1GB of RAM
- Stable internet connection

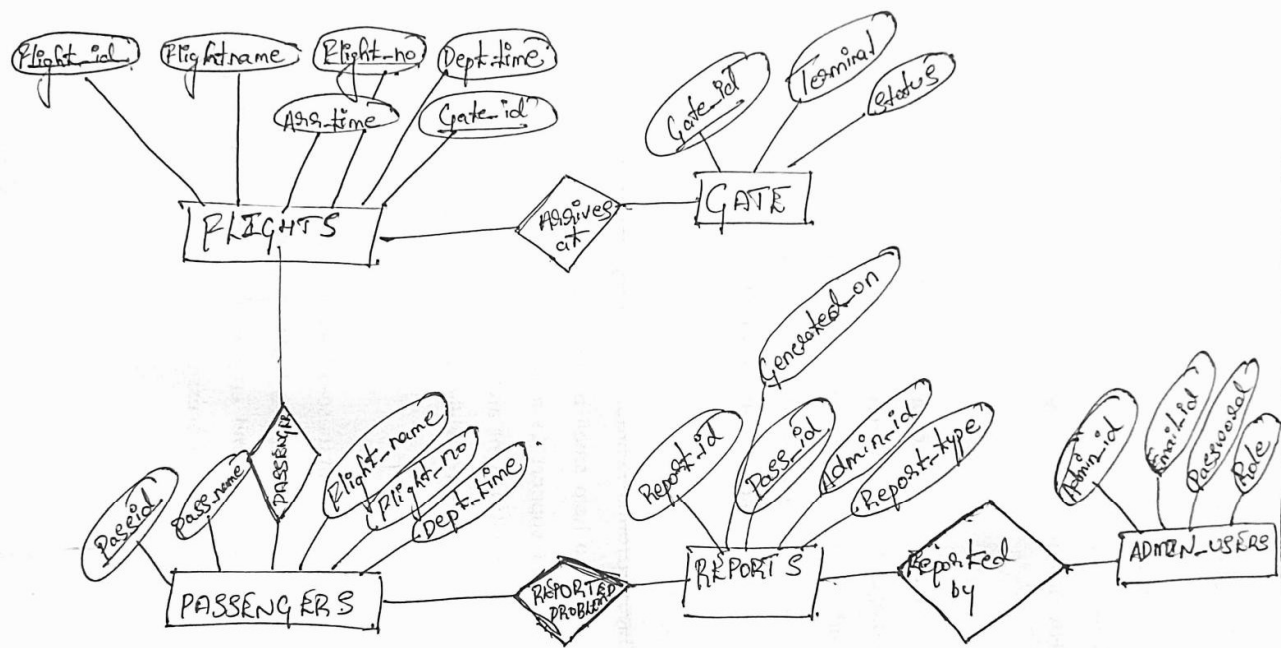

Software:

- Latest browser version recommended (Chrome, Firefox, etc.)
- VS CODE TEXT EDITOR installed

METHODOLOGY

The XENOS begins with a secure Sign In page, which serves as the entry point for all users. Users are required to log in using their registered email ID and password. Once successfully signed in, users are redirected to the Home Page, which serves as the central dashboard of the system. From the Home Page, users can navigate to various modules including Flights, Passengers, and Reports. The Flights page displays real-time data of all scheduled flights along with arrival/departure times, status updates, and destinations. Authorized users can add, modify, or delete flight records. The Passengers page allows viewing and managing of passenger details such as seat number, check-in status, and baggage information. The Reports page enables the generation of detailed reports on flight activity, passenger flow, and staff operations, which can be filtered by date or category and exported in various formats. The system features a role-based access model to ensure that only authorized personnel can view or manage specific data. Designed with a responsive interface, the platform is accessible across desktops, tablets, and mobile devices. All operations are supported by a centralized database, enabling real-time updates, data consistency, and efficient management of airport operations.

IMPLEMENTATION

The following software components need to be downloaded and installed to successfully run the **XENOS** project:

1. **Visual Studio Code (or any code editor)** can be downloaded and installed from <https://code.visualstudio.com/>.
2. **Node.js (version 18 or higher)** must be installed from <https://nodejs.org/>.
3. **PostgreSQL**, along with **pgAdmin** for managing the database, can be downloaded from <https://www.postgresql.org/>.

Once the required software is installed, the project setup and initialization can be done by following these steps:

Step 1: Initialize the Node.js project using the terminal with the command:

```
npm init -y
```

Step 2: Install the necessary dependencies for the server using the command:

```
npm install express pg path
```

Step 3: Set up the PostgreSQL database. Create the necessary tables and define their attributes using SQL queries or pgAdmin.

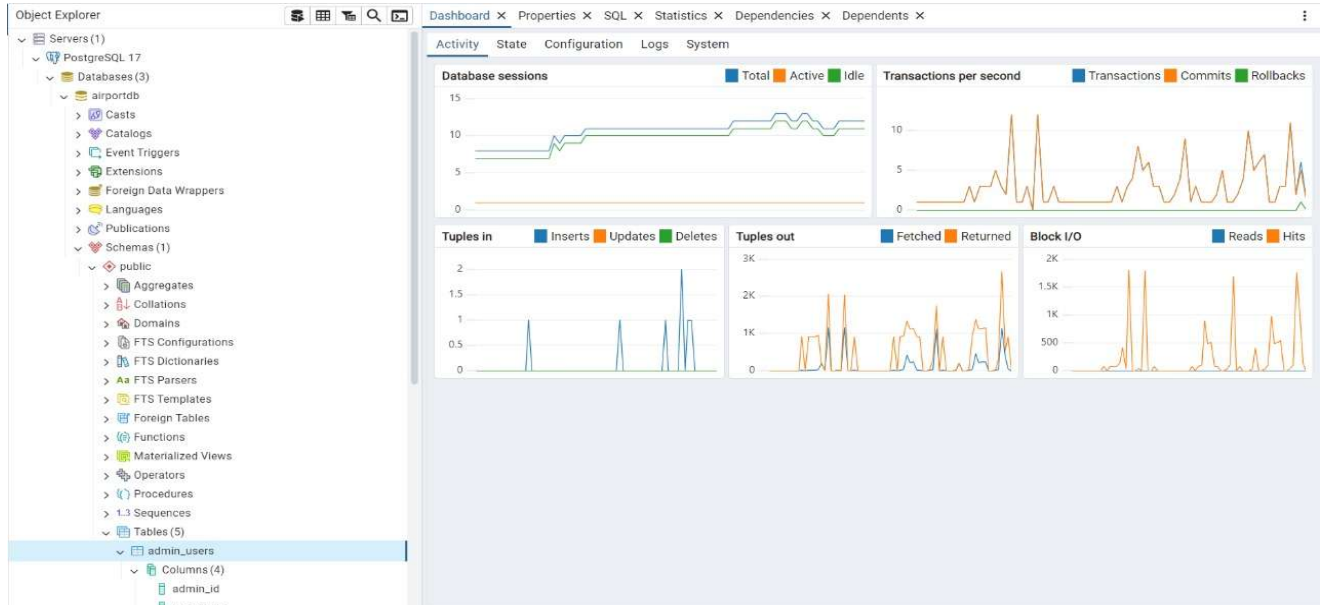

Step 4: Start the back end server by running the following command in the terminal:

```
node server.js
```

Step 5: Once the server is running, access the system via your browser at:

1. <http://localhost:3000/signup.html> – for user registration
2. <http://localhost:3000/flights.html> – for managing flight details
3. <http://localhost:3000/report.html> – for report generation

With these steps, the **XENOS** system will be fully functional and ready for use. The modular design ensures a smooth user experience while maintaining strong back end integration with the PostgreSQL database.

OUTPUTS

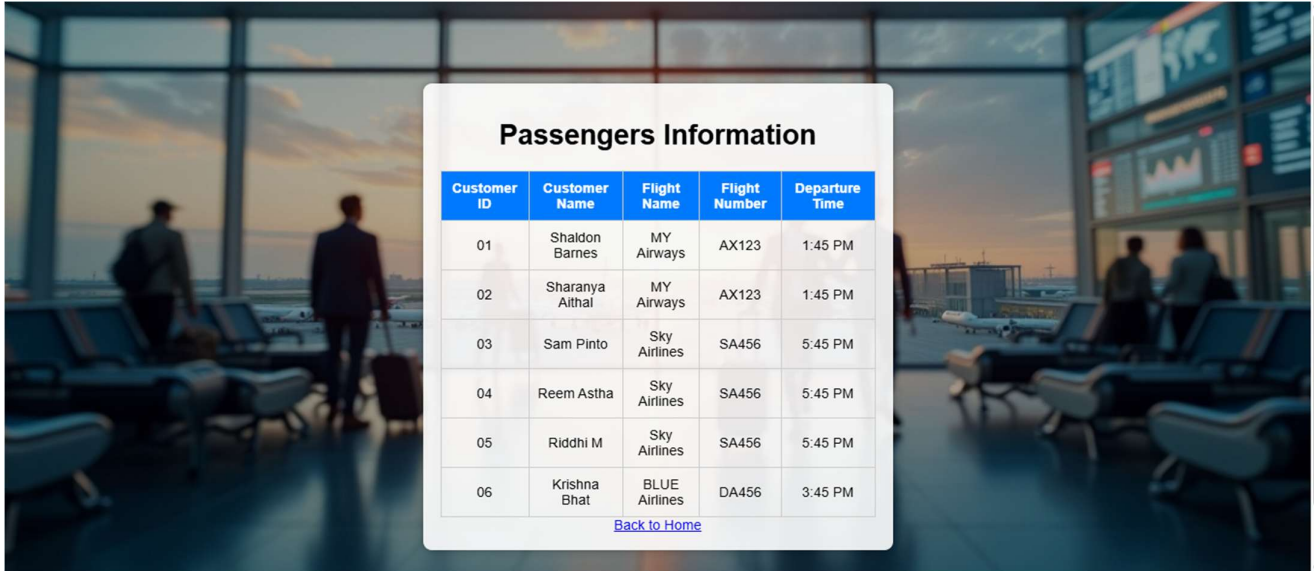

Welcome to XENOS

[Flights](#) [Passengers](#) [Reports](#) [Logout](#)

A blurred background image of an airport terminal with large windows showing a sunset and people walking with luggage. A white rectangular overlay is centered on the image, containing a table of flight information.

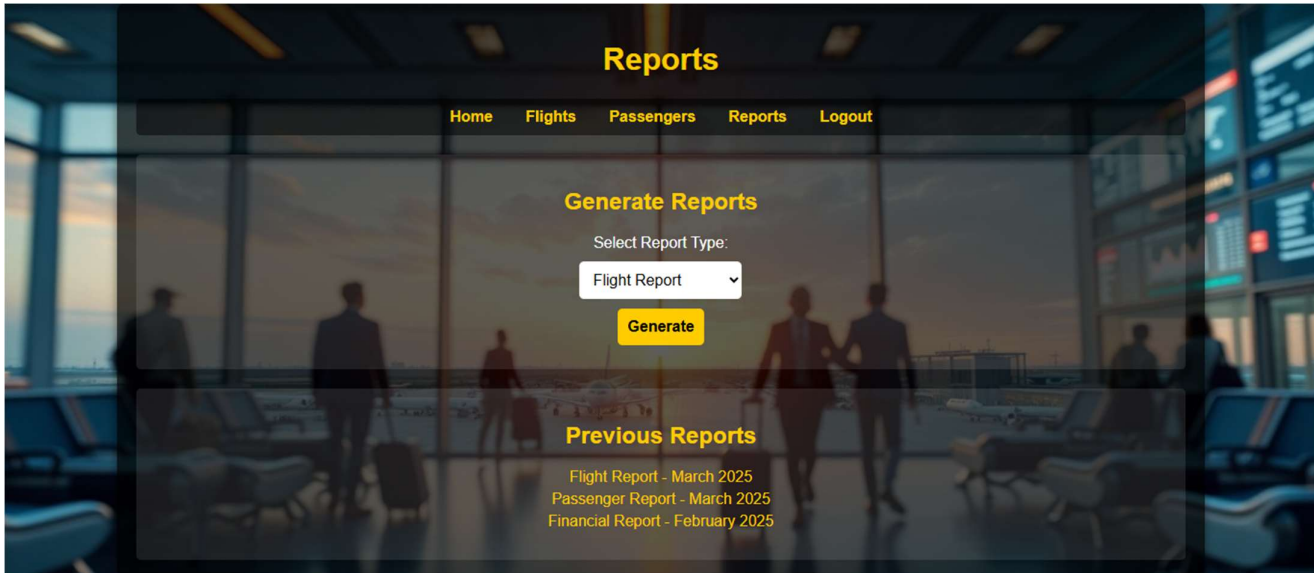

Flight ID	Flight Name	Flight Number	Departure Time	Arrival Time	Gate ID
101	MY Airways	AX123	10:30 AM	1:45 PM	G5
102	Sky Airlines	SA456	2:00 PM	5:15 PM	G8
103	RED Airlines	SA556	2:40 PM	5:30 PM	G1
104	BLUE Airlines	DA456	3:00 PM	6:15 PM	G3
105	GREEN Airlines	MA456	6:10 PM	8:15 PM	G8

[Back to Home](#)

A modal window titled "Passengers Information" is displayed over a blurred background of an airport terminal. The modal contains a table with 5 columns: Customer ID, Customer Name, Flight Name, Flight Number, and Departure Time. There are 6 rows of passenger data. Below the table is a "Back to Home" link.

Customer ID	Customer Name	Flight Name	Flight Number	Departure Time
01	Shaldon Barnes	MY Airways	AX123	1:45 PM
02	Sharanya Aithal	MY Airways	AX123	1:45 PM
03	Sam Pinto	Sky Airlines	SA456	5:45 PM
04	Reem Astha	Sky Airlines	SA456	5:45 PM
05	Riddhi M	Sky Airlines	SA456	5:45 PM
06	Krishna Bhat	BLUE Airlines	DA456	3:45 PM

[Back to Home](#)

The "Reports" page features a navigation bar with links to Home, Flights, Passengers, Reports, and Logout. The main content area includes a "Generate Reports" section with a dropdown menu for "Select Report Type:" currently showing "Flight Report", and a "Generate" button. Below this is a "Previous Reports" section listing three reports: "Flight Report - March 2025", "Passenger Report - March 2025", and "Financial Report - February 2025".

- Passenger Report - March 2025
- Financial Report - February 2025

CONCLUSION AND FUTURE SCOPE

The XENOS is designed to streamline and automate key airport functions such as flight scheduling, passenger information management, and report generation. Developed using web technologies like HTML, CSS, JAVA SCRIPT, and backed by a NODE JS, & POSTGRES SQL the system provides a centralized and secure platform for airport staff, crew, and administrative users. With an intuitive interface and real-time data handling capabilities, XENOS enhances operational efficiency, reduces manual errors, and ensures smooth coordination across departments.

The modular structure of the system comprising Sign In, Home Page, Flights, Passengers, and Reports ensures that users can easily navigate and manage their respective tasks. Secure login, role-based access, and seamless data flow between modules contribute to both the functionality and reliability of the system. The platform not only simplifies the workload of airport employees but also improves the overall management of day-to-day operations.

In the future, the XENOS system can be enhanced with features such as mobile application support for staff and crew to access data on the go, integration of real-time flight tracking for accurate updates, and automated notifications for delays or schedule changes. Additional improvements may include a baggage tracking module, advanced data analytics for better decision-making, and a multilingual interface to support international users. Introducing a passenger self-service portal for online check-ins and updates can further streamline operations and improve user convenience. These enhancements will make the system more efficient, scaleable, and user-friendly.
